-:- TISSUE SPECIFICTAY: Detected in adult peripheral blood leukocytes, trysue Spelen and liver. Also found in promyelocytic leukemia HL-60 cells, chronic myelogenous leukemia K562 cells, Burkitt's lymphoma Raji cells and colorectal adenocarcinoma SW480 cells. Not detected in HeLa Si, Molt-4, A549 and G431 cells. Not detected in HeLa Si, Molt-4, A549 and G431 cells.

C. -- SUBCELULAR ROCE IN TIGHT JUNCTIONS AND ADHERENS JUNCTIONS.

C. -- SUBCELLULAR LOCATION: PERPERSAM EMBRANE. CYTOPLASMIC SIDE.

C. -- ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2; ARE

PRODUCED BY ALTERNATIVE SPLICING.

C. -- SIMILARITY: CONTAINS 3 PEZ-DHR DOMAINS.

C. -- SIMILARITY: CONTAINS 1 SH3 DOMAIN.

C. -- SIMILARITY: BELONGS TO THE MAGUK FAMILY OF CELL JUNCTION PROTEINS.
              MEDLINE-96421547; PubMed=8824195; Beatch M., Jesaitis L.A., Gallin W., Goodenough D.A., Stevenson B.R.; Beatch M., Jesaitis L.A., Gallin W., Goodenough D.A., Stevenson B.R.; "The tight junction protein 20-2 contains three PDZ (PSD-95/Discs-Large/ZO-1) domains and an alternatively spliced region."; J. Biol. Chem. 271:25723-25726(1996).

-1- ALTENNATIVE PRODUCTS: 4 ISOFORMS; Al (SHOWN HERE), Cl, A2 AND C2;

-1- ALTENNATIVE PRODUCTS: 4 ISOFORMS; Al (SHOWN HERE), Cl, A2 AND C2;

-1- TISSUE SPECIFICITY: THIS PROTEIN IS FOUND IN EPITHELIAL CELL

JUNCTIONS. ISOFORM ALIS ABUNDANT IN THE HEART AND BRAIN WHEREAS

ISOFORM CL IS EXPRESSED AT HIGH LEVEL IN THE KIDNEY, PANCREAS,

HEART AND PLACEMYA. IN BRAIN AND SKELETAL MUSCLE, ONLY ISOFORM AL

IS DETECTABLE. ISOFORM CL IS FOUND IN NORMAL AS WELL AS IN MOST

IN NORMAL TISSUES.

SIGLI CHEM. STATES A ROLE IN TIGHT JUNCTIONS AND ADHERENS JUNCTIONS.

SUBJURIT: INTERACTS WITH OCCLUDIN.

SUBJURIT: INTERACTS WITH OCCLUDIN.

SUBJURITY: CONTAINS 3 PDZ/DHR DOMAINS.

SIMILARITY: CONTAINS 1 SH3 DOMAIN.

SIMILARITY: CONTAINS 1 GUANNICATE RIABSE-LIKE DOMAIN.

SIMILARITY: BELONGS TO THE MAGUK FAMILY OF CELL JUNCTION PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Proteans Expr. Purif. 19:227-234(2000).

Protein Expr. Purif. 19:227-234(2000).

Protein Expr. Purif. 19:227-234(2000).

I protein Expr. Purif. 19:227-234(2000).

a nonspecific substrate beta-casein. Promotes or induces cell death either by direct binding to and inhibition of BIRC proteins (also called inhibitor of apoptosis proteins, IAPS), leading to an increase in caspase activity, or by a BIRC inhibition-independent acaspase independent and serine protease activity-dependent, mechanism. Isoform 2 seems to be proteolytically inactive.

SUBUNIT: Interacts with Mxi2. The mature protein, but not the precursor, binds to BIRC2, BIRC3 and BIRC4/XIAP.

PRECURSORY INGS to BIRC2, BIRC3 and BIRC4/XIAP.

Intermembrane space. Released into the cytosol following apoptotic stimuli, such as UV treatment, and stimulation of mitochondria with caspase-8 truncated BID/BID.

I ALTERNATIVE PRODUCTS: 4 isoforms; 1/13B (shown here), 2/D-Omi, 3/P) and 4/P4; are produced by alternative splicing.

I PIN: Autoproteolytically activated.

I SIMILARITY: BELONGS TO PEPTIPASE FAMILY S2C.

I SIMILARITY: BELONGS TO PEPTIPASE FAMILY S2C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright.                                                       The present sequence is human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bol-10 and stimulates phosphorylation of Bol-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of cancer. It is also useful for the treatment of cancer. It is also useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders (e.g., according to an anemia myelodysplastic syndromes), myocardial infarctions, strokes, immune disorders (e.g., Crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.

                                                                                                                                                             The present sequence is predicted human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bol-10 and stimmlates phosphorylation of Bol-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of autoimmune disorders (e.g., salso useful for the treatment of autoimmune disorders (e.g., and Parkinson's disease, inflammatory disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders (e.g., annemia, myelodysplastic syndromes), myocardial infarctions, strokes, immune disorders (e.g., Crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.
An isolated caspase recruitment domain polypeptide useful for regulating growth and cell death and useful for the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                           Domain
```

```
The present sequence represents novel human caspase recruitment domain, CARD-11. The polynucleotide encoding this sequence was commain, CARD-11. The polynucleotide encoding this sequence was isolated from a human T-cell CDNA library. Also described are conveil human sequences for CARD-9 and CARD-10 (AAU01205, AAU01206) and rat CARD-9 (AAU01204). CARD-10 and CARD-11 interact with Bol-10 which is thought to activate nuclear factor (NF) kappaB can apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-10, or CARD-11.

They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Crohn's disease), and viral infection (e.g. HIV). The CARD polypeptide, polynucleotide and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening

(I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and oscreen compounds that interfere with the interaction of the polypeptide with plakoglobin The plakoglobin related diseases include basal cell carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey-Hailey's disease or Darier's disease, and ectodermal dysplasia/skin fragility syndrome. AAU73245-
                The
mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and proph/laxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation. cancer. NF kappab signalling, stress related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.

The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer;

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been scolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                ä
Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      830 Primers useful for synthesizing full length cDNA clones and their

The present sequence represents novel human caspase recruitment domain, CARD-10. The polynucleotide encoding this sequence was isolated from a human skin CDAR library. Also described are novel human sequences for ARD-9 and CARD-11 interary. Also described are novel human sequences corrected and CARD-11 interact with Bcl-10 which is thought to activate nuclear factor (NF)-kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. CARD-10, or CARD-11. They can be used for the treatment of Systemic lupus erythematosus), neurological disorders (e.g. and viral infection (e.g. HIV). The CARD pupperlide, polynucleciide and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal mapping, tissue typing), correct for requisition and/or modulate it. CARD sequences are potential targets for requiating inflammation, cancer, NF kappaB corrected and apoptosis in human disease. A bost call containing a polynuclectide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated plakoglobin interacting polypeptide (i). (I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases include basal carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal
                                                                                                                   Human; plakoglobin; cytostatic; osteopathic; dermatological; cardiant; plakoglobin related disease; skin carcinoma; acantholytic disease; basal cell carcinoma; squamous cell carcinoma; Naxos disease; extramammary Paget's disease; hart disease; skin blistering; subcorneal acantholysis; Grover's disease; Hailey-Hailey's disease; Darier's disease; ectodermal dysplasia; skin fragility syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 DSFYIRVNLAMEGRAKGE-LQVHCNEVLHVTDTMFQGCGCWHAHRVNSYTMKDTAAHGTI 60

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compression centering the protein occlusive ischaemia or vasospastic ischaemia) by measuring the protein sequences in ABB57020 to ABB57314) or by determining the expression profile of a gene group comprising these genes. The expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition improving drugs or thrappeutics for ischaemic condition improving drugs or thrappeutics for ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

                                                                                                                                                                                                                                                                                                                                     The invention relates to diagnosing endometrial cancer in a subject suspected of having endometrial cancer comprising determining the expression of a set of nucleal acid molecules or expression products in an endometrial sample suspected of being cancerous, where the set of nucleic acid molecules comprises at least 2 nucleic acid molecules comprises an array of at least 2 of the 50 nucleic acids bound to a solid substrate. Also included is a solid-phase protein microarray comprising at least 2 antibodies or its antigen protein microarray comprising at least 2 antibodies or its antigen properties from the 50 fully defined sequences as given in the specification, fixed to a solid substrate. The methods and arrays are specification, fixed to a solid substrate. The methods and arrays are treatment regimes and identification of lead compounds useful for the treatment of endometrial cancer. The present sequence is one of 50 proteins differentially expressed between cancerous and non-cancerous

The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
The sequence acta for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; plakoglobin; cytostatic; osteopathic; dermatological; cardiant; plakoglobin related disease; skin carcinoma; acantholytic disease; basal cell carcinoma; squamous cell carcinoma; Maxos disease; extramammary Paget's disease; hart disease; skin blistering; subcorneal acantholysis; Grover's disease; Hailey-Hailey's disease; Darier's disease; ectodermal dysplasia; skin fragility syndrome.

                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                      The invention relates to an isolated plakoglobin interacting polypeptide (I). (I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases include basal carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey's disease or Darier's disease, and ectodermal dysplasia/Skin fragility syndrome. AAU73245-AAU7324 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                    New polypeptide, useful for treating skin carcinoma or acantholytic diseases such as Grover's and Darier's disease, comprises a protein interacting with human plakoglobin and involved in transduction of plakoglobin related signal to nucleus
                                                                                                                                                                                                                                                                                                                                                                                    2 DSFYIRVNLAMEGRAKGELQVHCNEVLHVTDTMFQG-CGCWHAHRVNSYTMKDTAAHGTI 60

```
The invention relates to stomach cancer-expressed genes (AAI93442-AAI991317) and the encoded proteins (AAM93967-AAM94039). The GAAI934A2-AAI99317) and the encoded proteins for screening for the early stages of the disease. The proteins and peptides can be used as targets for screening for compounds to treat the disease. They can also be used for predicting micro-metastases. The gene can predict peritoneal dissamination.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises a fleast 15 nucleotides; or (b) a combination of an onligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the olynucleotide which comprises a 1'-end sequence of polynucleotide which comprises at 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and the full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the chetchion and/or diagnosis of the abnormality of the full-length cDNAs. The primers are also useful for the full-length cDNAs are primers allow obtaining of the full-length cDNAs are primers allow obtaining of the full-length cDNAs represent human amino acid sequences; and AAH13628 and AAH13633 to AAH13632 represent human amino acid sequences; and AAH13632 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5

The present invention relates to human kinases (PKIN) and polynucleotides encoding such proteins. PKIN sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of PKIN, particularly immune system disorders (e.g. acquired immune deficiency syndrome (AIDS), thymic hypoplasia, Crohn's disease, anaemia, asthma), neurological disorders (e.g. epilepsy, Charcor-Marieroch disease or seizures), call proliferative disorders (e.g. cancers such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma, myene therapy and developmental disorders (e.g. Down's syndrome). They are also used in gene therapy and protein therapy. The present sequence is human

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
